

# One piglet

(Stanislav Turošák)

There was a piglet who wanted to settle, because it did not want to live with a grandmother. It bought a nice piece of land and began to build a house. But it did not have a material, so it went to buy some bricks and building material. You need

5 bricks for  $1\text{m}^2$ . How many bricks does the piglet need for  $10\text{m}^2$ ? When the house was built, the piglet was sleeping and eating all the day. Once the wolf was walking around the house and knocked on the door. He asked: "How much is  $5.5$ ?" While a Piggy think about the sum the wolf has already climbed down the chimney. He fell into the soup and cooked in a hot boiler.
