

Three tasks

(Dominika Litviaková)

Once there was a little girl with her grandmother. They were the best friends. They lived in a small house in woods. Her parents died and she had only the grandmother. They decided to go to the forest to pick up the forest fruit. The fairy appeared and said. If you solve three tasks the girl's parents will return. „All right“ they said with one voice. So the first task is: Count, how many broadleaves are there in the forest, if there are 300 evergreens and broadleaves are 65 %. The grandmother could not count percent, but the girl could. „Well done!“ said the fairy. The second task is: Count how many minutes does the journey to the shop take, if you walk 2 metres for 2,4 seconds and the journey is 1 km long. They had a problem because they didn't have a paper. „What are we going to do?“ they were worried. Grandmother thought about wood to carve into it. They did it and solved the task. „OK“ said the fairy with admiration. So there is the third task: In the forest there are 40 squirrels, 75 hedgehogs, 38 roe-does and 20 foxes. The 5 squirrels, 1 hedgehog, 10 roe-does and 8 foxes died. How many animals are there in the forest now? The grandmother was scared. They solved two tasks but this was the most difficult task. They thought about it for a long time. The fairy was impatient. They had 2 minutes. When they had 10 seconds left, the girl shouted the correct answer. The fairy disappeared and the parents appeared in front of the girl. They embraced to each other. They lived happily ever after till they died.
