

# Little Red Riding Hood

(Lucia Rusnáková)

Once upon a time there lived a family with a small Little Red Riding Hood and her mother. They didn't have the father. One day her mother sent her daughter to go to her grandmother. The old woman was ill and it was necessary to bring her something to eat. She took a loaf of bread, 1,5 litres of juice, 5 pancakes and 10 cakes. The mother warned her daughter not to leave the path. As she was walking she met the wolf. She was afraid of him. He greeted the girl politely and she told him about her ill grandmother. He told her that grandmother will be very happy when she brings her a bouquet of flowers. When she was picking the flowers he ate from her basket:  $\frac{1}{4}$  of bread, 3,5 of pancakes, and 30 % of cakes and he drank 20 % of juice. How much food did she have? Little Red Riding Hood picked up the flowers from the meadow with the area  $6,5 \text{ m}^2$ . In which part there stayed the flowers if the meadow is 10,6 ares. When Little Red Riding Hood was in front of the grandmother's house, she knocked on the door and came in. She asked: Grandmother, why have you about 1% bigger eyes and about 3% bigger mouth? All the better to eat you with! Said the wolf and jumped out of the bed to swallow up Little Red Riding Hood. Fortunately the hunter saw it and he killed the wolf and set the grandmother and Little Red Riding Hood free. They lived happily ever after.
