

Danger in space

(Jakub Pakos)

In the space there were 12 spacecrafts, 1 space station and 41 transport ships. How many ships were together? Ships traded among themselves collected minerals and raw materials. From the raw materials they processed energy and electricity.

Once from the outer space came very large invading ships. They were the replicators. They were the machines from the planet MX13A4 and they had an idea to destroy all the ships, smooth and conquer the Earth to our universe. They have established a connection with us and demanded us to give up. We started attack as the first, we did not want to give up without a fight. We have destroyed 10 ships from 20 ships. It was just a small victory, but the war still continued. Day came and another 20 ships replicators came. They destroyed our 5 spacecrafts and 15 transport ships. How many ships did they leave? They had nearly destroyed the ship command, but help came. The asgards came. They destroyed all the ships. How many ships replicators did we destroy with asgards? Finally peace managed in the universe.
